

Hearing & Dizziness Testing

Hearing Testing & Hearing Aids

Specialized equipment is used to obtain accurate results about hearing loss. The tests are conducted in a sound-treated room with calibrated equipment. An examination will include inspection of the ear canal and eardrum with an otoscope and diagnostic audiologic tests. Results and recommendations will be reviewed following the evaluation.

Hearing loss is caused by medical problems about 10% of the time. If a medical problem is recognized, patients will be referred to an Ear, Nose and Throat physician called an Otolaryngologist. Most persons with hearing impairment can benefit from the use of hearing aids. Our audiologist can help you find the best hearing aid solution for your individual needs.

Dizziness Testing

A VNG (Videonystagmography) test is performed to evaluate the balance portion of the inner ear. Goggles with a camera will be placed over your eyes and a computer will record eye movement as you follow a moving target with your eyes and as you move your head and body. Cool and warm air will be placed in your ear canal to directly stimulate your inner ear. During the test, patients may feel dizzy from portions of the evaluation. The dizziness is usually mild, lasting only a minute or two.

Tinnitus

Tinnitus is often referred to as "hissing, roaring or ringing". It can range from high pitch to low pitch and can be perceived in one or both ears, or in the head. Many individuals suffering from tinnitus report interference with sleep, concentration, and attention to detail. Because tinnitus may be symptomatic of a treatable disease, it is important to try to identify and resolve a cause before deciding on the management approach.

COMPREHENSIVE HEARING SCREENINGS are always free of charge!

HEARING DEVICES All basic in house repairs and major repairs on all models and all manufacturers. We will access the problem, repair it on-site or send it out for repair.

OPTIMUM PERFORMANCE for your hearing devices! We can assist you with regular professional cleanings, critical to the life expectancy of your hearing device!

CUSTOM SWIM MOLDS and hearing protection

ASSISTED LISTENING DEVICES for TV and phone

What you need to know about Hearing Aids

HERE ARE THREE FACTS YOU SHOULD KNOW:

1. Exposure to excessive noise is the primary reason for hearing loss - a loud workplace, sporting activities such as hunting, or live music often lead to hearing loss.
2. 65% of individuals with hearing loss are below the retirement age and often still employed - the popular notion of "your grandmother's hearing aids" no longer applies. Many with hearing loss experience difficulty in the workplace.
3. 95% of individuals with hearing loss could be successfully treated with hearing aids; only 23% currently use them - surprisingly, hearing loss is the single most preventable disability that often goes untreated.

To help you understand hearing loss and hearing aids, we offer complimentary hearing screenings for you and your family.
